

First open the camera in the web browser (note you want to log into the camera directly using the cameras ip not the recorder)

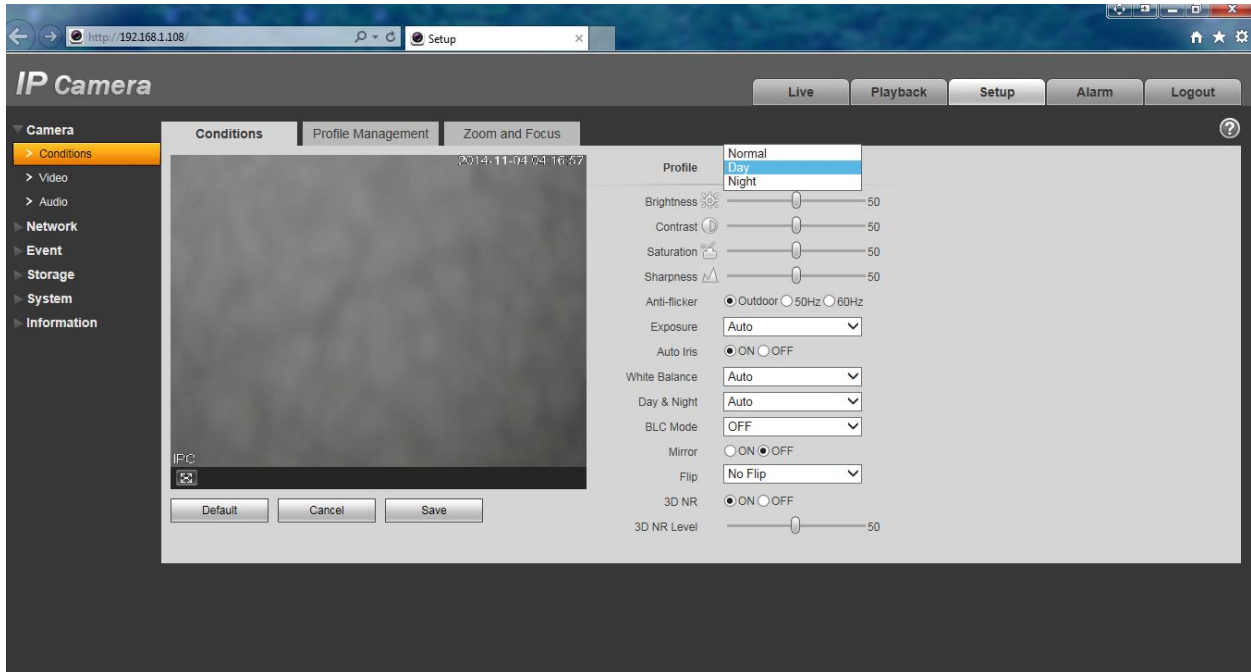

Next go to setup.

Click on Profile Management tab at the top and set the Profile mode to Schedule then set up your day and night time range. Then Save.

Next go back to Conditions and select what profile you want to set up day or night.

Once selected set the Exposure mode to Manual and then change the shutter rate. On newer cameras you can go up to 1/100000. I would suggest using 1/4000 to start and then adjust from there to fit the install accordingly.
